

1. Fetch latest git fetch origin
2. Ensure up to date with remote git rebase origin/main
3. Verify ahead count (should be ≥ 10) git rev-list -count origin/main..HEAD
4. Push safely (use SSH; ensure correct key is added to GitHub for Clemzy-alt or use your account that has access) git remote set-url origin git@github.com:Clemzy-alt/sin-000-healthsafe.git ssh-add -l git push origin main

If SSH key is for a different GitHub account (moropenelebo-coder) and that account has no write access: - Add the SSH key tied to Clemzy-alt to ssh-agent OR - Switch to HTTPS with a Personal Access Token (PAT): git remote set-url origin https://@github.com/Clemzy-alt/sin-000-healthsafe.git git push origin main

Or temporarily use a token with HTTPS: git remote set-url origin https://ghp_xxx@github.com/Clemzy-alt/sin-000-healthsafe.git git push origin main

5. Verify after push git fetch origin && git status -sb
